

GAURAV LONARI

Full Stack Product Engineer

Pune, India | +91 9370729899 | gauravlonariofficial@gmail.com

linkedin.com/in/gauravlonari | github.com/gauravlonari | Open to Remote (IST) with proven US-timezone delivery

SUMMARY

Full stack product engineer, 3+ years on the enrolment and benefits platform at Loop Health, a health insurance platform covering 1M+ members. Own the stack end to end: React and TypeScript frontends, Node.js microservices on Cloud Run behind an API Gateway, CI/CD, and production observability. Designed and shipped the enrolment portal that processes **₹100Cr+ (~US\$12M) in annual premium** for corporate clients. **#1 contributor** to the company's shared React component library. Cut production deploys from 10 minutes to under 1 minute, build size 61%, and a 20,000-row operations page from 2GB to 40MB of heap. Promoted from intern to SDE-2 in 24 months.

SKILLS

- **Core:** TypeScript, JavaScript, React 18, Redux Toolkit, React Query, TanStack Table, React Native, Node.js, Java, SQL
- **Backend:** Node.js microservices, Express.js, Spring Boot, REST APIs, GraphQL, system design, authentication, Single Sign-On (SSO), OAuth 2.0, JSON Web Tokens (JWT), Identity Provider (IdP) integration, PostgreSQL, MongoDB
- **Cloud:** Google Cloud Platform (GCP), Cloud Run, API Gateway, Cloud Load Balancing, load balancing, Firebase, Docker
- **Platform and Delivery:** GitHub Actions, CI/CD, pull-request preview environments, Workload Identity Federation (WIF), Vite, build optimization, web performance, feature flags, Flagsmith, Agile/Scrum
- **Reliability and Security:** Datadog RUM, Datadog dashboards, custom vitals, on-call alerting, Sentry, Core Web Vitals, unit testing, integration testing, Jest, Vitest, Playwright, Content Security Policy (CSP), SOC 2, penetration testing, VAPT remediation
- **AI Engineering:** prompt engineering, Model Context Protocol (MCP), LLM coding agents, agent-rule and repository-context authoring, Claude Code, GitHub Copilot, Cursor

EXPERIENCE

Software Development Engineer II | Loop Health, Pune, India (Remote) | July 2025 – Present

- Architected the **corporate benefits enrolment portal**: React 18 frontend, 3 Node.js services on Cloud Run behind GCP API Gateway. Now carries **₹100Cr+ (~US\$12M) in annual premium** for clients of 800 to 8,000 employees.
- Designed **idempotency and state-transition guards** on enrolment checkout, after a race between async benefit writes and checkout confirmation could wipe member benefits and falsely mark users enrolled. Made the checkout path replay-safe.
- Moved cross-service routing to the **API Gateway** rather than per-service config: one path prefix and CORS allowlist for every environment, so preview, staging and production share a single contract instead of three that drift.
- Cut production deploy time **from 10 minutes to under 1 minute**. Parallelised GitHub Actions jobs, partial-cloned full-history checkouts, pinned the Node toolchain, and wired Slack release reporting into every deploy.
- Shipped the enrolment slice of a company-wide **per-PR preview system**. Every pull request gets a usable product link in **under 60 seconds**, auto-updated on each commit, removing the multi-day wait on shared staging.
- Instrumented **21 custom Datadog RUM duration vitals** and built the team's production health dashboard: p95 latency and error rate by endpoint, Core Web Vitals by route, errors-per-session by release.
- Reduced **MTTR on frontend incidents from 2 days to under 1 hour** by pairing that instrumentation with on-call alerting. Production escalations went from routine to rare.
- Reduced production build size **61%, from 72MB to 28MB**, via tree shaking, CDN caching, route-level code splitting and dependency pruning. Took third-party SDKs off the /login Largest Contentful Paint path.
- Brought /login load time down **67% (4.5s to 1.5s)** and initial JavaScript payload down **93% (3.3 MB to 230 KB)** via code splitting, lazy chunks and dropping the Firestore SDK; Lighthouse Performance 60 to 90.
- Migrated dev and production deploy pipelines from long-lived service-account keys to **keyless Workload Identity Federation**. Eliminated Content Security Policy violations and took ownership of penetration-test (VAPT) remediation for the portal.

- Wired an internal **Model Context Protocol (MCP) integration** that streams live browser UX context into AI coding agents, and authored the repository's agent rules so AI-assisted changes follow team conventions.
- Led and mentored 1 SDE and 1 intern through scoping, stacked-PR review and design feedback. Led code review across 8 repositories, **1,000+ pull requests** reviewed to enforce TypeScript, testing and commit standards.

Software Engineer | Loop Health, Pune, India | July 2024 – July 2025

- Launched the **employee benefits selection portal** that became the foundation for the corporate enrolment platform, shipping the first production version in 10 days.
- Made the operations console's member-details page render **20,000+ member records in one view**, cutting heap **from 2GB to 40MB** through table and row virtualization. Usable on low-end operator machines.
- Engineered the enrolment and onboarding journey that member onboarding runs through, contributing to the platform's **1M+ covered members**, with data-loss alerting on the async pipeline that also simplified recovery.
- Hardened HR registration in the Node.js backend across 8 PRs: mobile, name and currency sanitisation, cross-policy duplicate-credential detection, empty coverage and salary backfill, and hard delete on mid-term rejection, cutting bad-data errors at ingest.
- Configured error reporting and HTTP-failure trace capture in Sentry across 3 frontends, cutting time to detect and mitigate production errors.
- Delivered **custom Identity Provider SSO** and email-OTP login, plus a self-serve access-management module that took engineering out of the HR onboarding loop.

Software Engineer Intern | Loop Health, Pune, India | July 2023 – June 2024

- Built and maintained 10+ reusable components in **Loop's shared React component library**, used across every client application, including the data-table suite on TanStack Table. Standardised UX and raised frontend delivery speed team-wide.
- Revamped the **HR Dashboard (HRD)** and drove adoption from 20% to a **100% rollout**. Delivered its self-serve platform for mid-term policy amendments (endorsements), taking processing from **1 to 5 bulk batches per day**.
- Ported the HR Dashboard codebase from JavaScript to **TypeScript** over 10 months, leaving 2 of 621 files in JavaScript; added JSON payload compression and Excel parsing for bulk operations, and introduced feature flagging for per-client rollout.

Full Stack Engineer, Contract | Caliber, Missouri, USA (Remote) | April 2023 – June 2023

US employer wellness-challenge platform

- Implemented the challenge lifecycle from creation to completion with transactional email per phase, Firebase Auth SSO, and Google Fit API progress tracking on a React and Material UI frontend over Spring Boot.
- Ran the engagement fully asynchronously across a 10.5-hour IST/CST offset, working from written specs against US-timezone review cycles.

Full Stack Developer Intern | The Innovative Solutions, Pune, India | October 2022 – April 2023

Government software contractor

- Owned delivery of 2 government-funded platforms as tech lead and full stack developer: a parks management app and the National Urban Livelihoods Mission (NULM) street-vendor registry.
- Developed four-tier role-based access control, dynamic forms, a multi-stage document verification workflow, PayU payments with invoice generation, and the MongoDB schemas and JWT-authenticated Express APIs behind both apps.

EDUCATION

Bachelor of Technology (B.Tech) in Computer Engineering | Vishwakarma Institute of Information Technology, Pune | Sept 2024 | GPA 9.73/10 | Vice-President, Training & Placement Cell

Diploma in Computer Engineering | Government Polytechnic, Pune | Sept 2021 | 96.47%, Silver Medallist (Department)

PUBLICATIONS

"Streamlining IoT Simulation and Cloud Integration With a Unified Platform"; "Educational AR App for Enhancing Classroom Learning"

AWARDS

5-star Java badge on HackerRank; 100+ LeetCode problems solved
